

## **Progress 5 Test Case:**

### **Result:**

- Due to issues mentioned within the previous code and idea I have shifted my focus to developing something others will find value in using. Through that I have looked at doing something like my first idea. Through this I started a wordle type game as I have seen videos of people building such games in python and to me MATLAB is greatly similar. Unfortunately, the current code does not run as anticipated.

### **Reflection:**

- The code does not run but my idea is far firmer, and I love the idea of building something others may actually use. Due to many reasons, I think I will utilise a similar idea and push it further with a more complex application that makes use of similar things to the current wordle idea. I am learning French and have been for several months without the use of an application, I think that could be a good idea to follow.
